

A network diagram is overlaid on the text. It consists of numerous circular nodes in various colors (purple, yellow, orange, red, pink) connected by thin, semi-transparent lines of corresponding colors. The nodes are distributed across the entire image, with a higher density in the upper half. The lines connect nodes both horizontally and diagonally, creating a complex web-like structure that spans the width and height of the image.

The search term describes relatively large natural bodies that revolve in orbits around the Sun or other stars. The term does not include small bodies such as comets, meteoroids, and asteroids, many of which are little more than pieces of ice or rock. The ones that orbit the Sun are part of the solar system, which includes the Sun and all the bodies that circle it. The one on which we are living is called earth.
